

QR ORDERING AD ECOSYSTEM

MASTER MANAGEMENT & CONFIGURATION GUIDE

This master document is designed for the platform administrator, restaurant owner, or advertising sales agent. It details how to configure, prioritize, and manage advertisements served through the Google Sheets database.

1. Glossary of Terms (Ad Tech Basics)

Use these core metrics when pitching ad spaces to prospective local business advertisers (e.g., local cabs, theaters, spas) to show concrete business value:

Term	Definition	Example / Math
Placement	The designated visual area on the customer's phone screen where the advertisement renders.	E.g., <i>Menu Landing, Empty Cart.</i>
Impression	Logged when an ad enters the viewport and is visible (>50% visibility on screen for at least 1 second).	Prevents billing advertisers for ads loaded below the fold that were never actually seen.
Click	Registered when a user taps the ad component, immediately opening the advertiser's target URL.	Redirects the client to their custom website, booking link, or email inquiry page.
CTR (Click-Through Rate)	The effectiveness ratio showing the percentage of views that turned into active link clicks.	CTR = (Clicks / Impressions) * 100

Term	Definition	Example / Math
CPC (Cost Per Click)	The bidding model where the advertiser pays only when a user actively clicks their ad.	E.g., A bid of \$0.50 means 100 clicks will cost the advertiser \$50.00.

2. Placements Guide (Where the Ads Show)

To configure where an advertisement renders, type one or more of the following keywords inside the "**Placements**" column in your Google Sheet (separated by commas for multiple locations):

Keyword	Screen Location	Target Audience / Best For
menu_landing	Top sliding banner of the main food Menu.	Local salons, coffee shops, high-priority restaurant specialties. High visibility.
cart_empty	Inside the bottom cart sheet before items are added.	Impulsive offers, dinner sponsors, local retail shop discounts.
order_tracking	Halfway down the real-time Order Preparation screen.	Local cinemas, entertainment hubs, waiting games. Captures high dwell time.
bill	Directly beneath the Digital Receipt upon food delivery.	Local cab bookings, bars/lounges, next-destination planning.

3. Spreadsheet Configuration (AdCampaigns Sheet)

Configure your campaigns in the "**AdCampaigns**" spreadsheet tab using these columns:

- **Campaign ID:** A unique key identifier (e.g., C_201, C_202).

- **Advertiser:** Name of the brand paying for the space.
- **Headline:** The bold primary title (max 40 characters recommended).
- **Subtext:** Brief tagline description explaining the deal.
- **Image URL:** Web link to a high-resolution banner image.
- **Target URL:** Web destination opened when clicked.
- **Bid CPC:** Bidding price per click.
- **Placements:** Where it appears (e.g., `menu_landing`, `order_tracking`).
- **Category Target:** Restricts ads to specific food categories (e.g., `Desserts`).
Leave blank for all.
- **Status:** Set to `ACTIVE` to serve. Change to `INACTIVE` to pause the campaign.

4. Rotation & Optimization Algorithm

The system prioritizes ads programmatically to maximize revenue without disrupting the restaurant's loading speed:

$$\text{eCPM (Expected Yield)} = (\text{Bid CPC} * \text{Historical CTR}) * 1000$$

Campaigns with higher bid values and stronger user engagement are rotated more frequently. Newly added campaigns are given a temporary "Exploration Bonus" to collect baseline click statistics.

Offline Fallback: If no campaigns are active in Google Sheets or the network fails, the system automatically displays your clean self-promotional lead generation banners prompting local businesses to rent the space.

5. Analytics Logging (AdAnalytics Sheet)

Every view and click is saved automatically in the "**AdAnalytics**" tab with the following headers: *Timestamp* | *Event Type* | *Campaign ID* | *Placement* | *Restaurant Name*. You can create a simple pivot table on this data to track total earnings and send monthly performance reports to your advertising partners.
